# 84. Largest Rectangle in Histogram

Hard 15036 215 Add to List Share

Given an array of integers heights representing the histogram's bar height where the width of each bar is 1 return the area of the largest rectangle in the histogram.

Example 1:

Input: heights = [2,1,5,6,2,3]

Output: 10

$$ans = 2 \cdot 6 = 12$$

$$A = h \times w = 6$$

$$w = nsol - nsox - 1 = 4 - 2 - 1 = 1$$

```

# Word Meaning

You are required to create a **dictionary** consisting of word and its meaning.

Take an integer N as input and Continue the process until Case 4 is not achieved.

- If N==1, take word and meaning as input from user and add it to the dictionary.
- If N==2, take a word (as input) from the user and print its meaning, if the word is not found print -1.
- If N==3, take a word as input from the user and delete it from the dictionary.
- If N==4, Close the dictionary (Exit the program).

Sample Input 0
